Manufacturer reserves the right to discontinue, or change at any time, specifications or designs without notice and without incurring obligations. Copyright 2002 Carrier Corporation. Form OM58107. Replaces OM58102. Select Product Category Just enter the model number below, and we'll give you a list of links to all the documents associated with it. Rather than have you commit them all to memory, we made our model numbers easy to find. If you don't happen to have them handy, you'll also find the model number printed right on the unit. If your heat pump is geothermal, the model information should be easily found on the front of the unit.

You should see the model number printed on rating plate or decal. Still unable to find that model number. Just call your local Carrier Expert. He or she will be happy to help you. Make sure the temperature is set cooler than the current indoor temperature. If it is not running, make sure the breakers in your home's breaker box or electrical panel are in the ON position. Make sure it's in the ON position. If the system is set for cooling, the blower motor should be running. If not, check to make sure your indoor unit switch is in the ON position. If you have one inch thick furnace filters, a once a month change is recommended. If you don't change it, the filter will eventually block the proper airflow and cause your outdoor air conditioner unit to shut down. Return air grilles are larger and are located on a wall or the ceiling in newer homes. Older homes frequently have return air grilles on the floor. NOTE If your system control has a "Constant ON" feature, you will not always feel warmth, even though air may be blowing. If it isn't, your system won't know to provide heating. Try turning the fan to ON using the fan switch on the control or thermostat to test for power to the furnace. If you have one inch thick furnace filters, a once a month change is recommended. If you don't change it, the filter will block the proper airflow and strain your furnace. Return air grilles are larger and are located on a wall or the ceiling in newer homes. Older homes frequently have return air grilles on the floor. NOTE If your system control has a "Constant ON" feature, you will not always feel warmth, even though air may be blowing. Verify that the circuit breakers are ON or that fuses have not blown. If you must reset breakers or replace fuses, do so only once. Contact your Carrier expert for assistance if the breakers trip or the fuses blow a second time. Check air filters for accumulations of large particles. Check for blocked exhaust air grilles or ductwork.

Keep grilles and ductwork open and unobstructed. Defrost time could be five to 20 minutes,

depending on temperature and settings. With this information, the dealer will be able to correct any problems. Make sure that the condensate drain tube has a slight slope and is not kinked. Provide your model and serial number. With this information, the dealer will be able to correct any problems. Water likely means the support base has shifted since installation and is no longer level. Soak the core in warm water and mild soap for three hours and then rinse under warm not hot water. Use a vacuum cleaner to remove accumulated dust and then handwash in warm water. Filter life varies from home to home and is based on several factors, but most last from eight to 12 months. If your geothermal unit is connected to well water instead of a closed loop, we recommend the heat exchanger inside the unit be cleaned periodically to prevent the buildup of minerals that can reduce system performance. No additional import charges Professionals Need. Carrier Weathermaker Service Manual 58sxc High Efficiency Domain 1 Hash 240b55515517b56be44450e7fef13fc7 Download Full Version Here. Reload to refresh your session. On RED LED boards stored status codes can also be erased when power 115 VAC or 24 VAC to control is interrupted. Check for Miswired gas valve Defective control valve relay Inducer will run until fault is cleared. Check for Leaky gas valve Stuck open gas valve Check for Excessive wind Proper vent sizing Defective inducer motor Low inducer voltage 115VAC Defective pressure switch Inadequate combustion air supply Restricted vent Disconnected or obstructed pressure tubing Low inlet gas pressure if LGPS used If it opens during blower on delay period, blower will come on for the selected blower off delay. Blower will run for 4 minutes or until open switch remakes whichever is longer. Flame rollout switch requires manual reset. Check for Restricted vent Proper vent sizing Loose blower wheel Excessive wind Dirty filter or

restricted duct system. Defective blower motor or capacitor. Defective switch or connections. Inadequate combustion air supply Flame Rollout Switch open. If flame signal lost during blower on delay period, blower will come on for the selected blower off delay. Replace control if status code repeats. If status code recall is needed, briefly remove then reconnect one main limit wire to display stored status code. On RED LED boards do not remove power or blower door before initiating status code recall. After one status code recall is completed component test will occur. Login to post Open air handler and take a picture of the low voltage tstat wires and where they are landed. Remove all thermostat wires from control board. Then replace the 5 amp fuse that is likely on the board.

Fuse likely looks like one for a car blade style. Put a jumper small piece of wire from the R terminal to the G terminal and turn power back on to unit. This should bring on the indoor blower. Let me know how that goes!! If you need further help, reach me via phone at Sounds almost cut and dry that your problem is on your tstat wire outside. Inspect the wire carefully for chew marks or bare spots. Need the wire fixed first!! You could, first, disconnect all low voltage from the board taking picture first and replace fuse and cycle power. If still no leds, likely have a bad board ALSO. Best Wishes! If you need further help, reach me via phone at Make sure to read the codes several times and see the code from the beginning so you make sure the code starts with that digit. Knowing this furnace means; the code diagnostic recommendation is just that, a suggestion. It will not tell a trained tech what to fix, only a starting point and telltale signs. Code 21 is the gas valve lockout, and will not reset. May be a gas valve, relay or control board most likely. Call someone. Its complex for a trained person too, so if youre not familiar, this isnt something to make a mistake on. Count the blinks next time it fails. Carrier units will have two different blinks depicting the error code such as one blink followed by a pause than 3 blinks giving you an error code of 13. Then look at the wiring diagram, it will have an error code chart telling you where to start with your diagnosis. You already know that if you remove the cover it erases the error code, so look thru the small window first. If you need further help, reach me via phone at We replace the motherboard whatv else could be wrong Answer questions, earn points and help others. If twinned, refer to twinning kit instructions. Error Code 11 No previous code Stored status codes are erased when power to control is interrupted.

Error Code 12 The blower is on after power up Blower runs for 90 seconds if the unit is powered up during a call for heat. Error Code 13 Limit or flame rollout switch lockout Control will autoreset after 3 hours. Reset the switch or replace fuse link. Error Code 14 Ignition lockout Control will autoreset after 3 hours. Error Code 21 Gas heating lockout Control won't autoreset. Check for either a badlywired gas valve or a defective control. Error Code 22 Abnormal flameproving signal Flame is proved while the gas valve is deenergized. Check for either a leaky or stuckopen gas valve. Error Code 23 Pressure switch didn't open Check for an obstruction in the pressure tubing or a pressure switch that is stuck closed. Error Code 24 Secondary voltage fuse is open Check for a short circuit in the secondary voltage wiring. Error Code 31 Pressure, draft safeguard, auxlimit switch, or blocked vent switch didn't close or reopened, downflow only If open for longer than 5 minutes, the inducer will shut off for 15 minutes before retry. Check for low inducer voltage; proper vent sizing; defective inducer motor; defective blower motor or capacitor; defective pressure switch; restricted vent; excessive wind, inadequate combustion air supply; or obstructed pressure tubing. Check for defective blower motor or capacitor; dirty filter or restricted duct system; loose blower wheel; faulty switch or connections; or inadequate combustion air supply. If the flame signal is lost after the trial for ignition period, the blower will come on for a 90 second recycle delay. Check for buildup on the flame sensor; proper microamp distribution to the flame sensor; defective gas valve or turned off gas valve; faulty hot surface ignitor; low inlet gas pressure; the manual valve is shutoff; continuity of control ground; low flame carryover or rough ignition; ungrounded flame sensor. Where can I get buy the TESTER Id check the pressure switch. There's a tube from the exhaust fan to a little either silver or black disc looking thing. That disc is the pressure switch. You have to keep a continuous suction on the tube but if it lights then that's your problem. Most likely the port at the fan needs to be cleared with a paper clip. Why not just call the contractor, and let him diagnose and repair it. A plastic thumb screw hold the panel on. There is 2 more panels under the initial panel, one has the blinking LED. Code 31, 32 and 43 is a pressure switch lockout. 14 and 34 are ignition proving lockouts. If it is under warranty, let a tech repair it as Beenthere has posted. LED light indicate Code 32. Please let me know if you both have followup suggestions. I take note recommendations by Houston and Beenthere and I plan to call the Furnace Contractor. I do have ONE more year of warranty. In the meantime, I figured that I must learn some basic trouble shooting and maintenance of the furnace. I am very impressed with this DIY website and prompt and succinct response from experts like you all. Thanks I use the direct link url from my photobucket account. While in this reply box, up above is a yellow square looking icon that you click. That's what I do.

It's still a pressure switch issue, but a broader one than simply just the pressure switch unless of course it has failed. Please let us know the outcome. If you have voltage but the ignitor is not glowing the ignitor is bad. Any signs of mud divers or wasps nest in the vent pipe. Is the vent cap smashed. Does the tubing to the pressure switch have any holes I've seen rats chew this hose Do you have good wire connections to the pressure switch. Do the 2 wires to the pressure switch have green corrosion present at the connections to the circuit board. If you had a manometer. What is the negative pressure reading to the pressure switch when this lockout occurs [www.photobucket.com](http://www.photobucket.com)

can be used to post pics. A pro should have a manometer to check the negative pressure to the pressure switch. If it is under warranty. I showed him what I tried to do with a paper clip, to dislodge the scaling. It seems my paper clip was not strong enough and sharp enough. For fear of causing inadvertent damage, I did not want to force it either. The blockage got cleared in no time. From there on, everything worked worked okay. He showed me how to remove the flame sensor, clean it lightly with fine sand paper and put it back. My sincere thanks to all the folks DOC, Houston, turnermech that helped as well as Mr. Nathan who introduced me to DIY forum. Thanks and Regards DNM  
Otherwise if your manual is not there it should have been left with the furnace You can download it from Carriers website. Where can I get buy the TESTER. Please try again. Please try again. Eliseo Videos for this product 024 Click to play video Customer Review Cheap Part Benjamin Bertrand Next page Upload your video Video Customer Review Great deal.

See full review Eliseo Onsite Associates Program To calculate the overall star rating and percentage breakdown by star, we don't use a simple average. Instead, our system considers things like how recent a review is and if the reviewer bought the item on Amazon. It also analyzes reviews to verify trustworthiness. Please try again later. M. Hadden 5.0 out of 5 stars Those previous parts, clearly marked with Jekel, went bad after a year. Hopefully this one is not made by Jekel no label claiming that it is and will last longer. Changing the old one with this one was a breeze pun intended. One thing to note this is for the motor only. It did not include the pigtail and fan shown in the picture. But you should be able to salvage those from your current setup. Luckily I was able to carefully bend it back straight without any further damage. It spins up and creates the draft, BUT the shaft is bent or warped or maybe the alignment of the bearings and so the entire assembly is slightly off balance, almost guaranteeing premature failure. I thought of returning it to see if a different one had better rotation, but ultimately decided to take my chances since I needed the furnace up and running. It was not hard to replace at all, but would recommend getting the gasket kit as well or possibly some red hightemp silicone. Also, the main shaft was a little shorter than the original, and so the fan wheel had to be mounted at the very limit of what was possible to still firmly attach with the set screw. You might also want to get a new fan wheel. I was able to get the small allen bolt to break free after soaking in WD40 for an hour, but could easily see a seized setscrew, and thus needing to cut the shaft on the old one to get the mounting plate free for use on the new motor. Make sure you clean up the parts really well, so everything seats nice and flat. At less than half the price of an OEM motor, as long as it lasts a few years, its prob a good value, but only time will tell.
