When I plug it in, the power supply fans spin up but that is it. All my connections are good, I checked them. I have got some blinking lights a few times but that's the farthest I've got. The CPU fan and case fan won't spin up or anything and there is no display. Also upon further messing with the server I notice that when I plug it in, the lights that blink are two lights on the SCSI pci board I have installed, the left front power light and two of my three drives middle lights. Do you get any POST codes. Which Motherboard is installed. Rgds, By using this site, you accept the Terms of Use and Rules of Participation. To reduce the risk of electric shock or damage to the equipment when installing, maintaining, or servicing Enterprise products, observe the following precautions. Some Enterprise products contain power supplies that are capable of producing hazardous energy levels. <http://www.e-midas.ro/files/04-ktm-525-exc-manual.xml>

- **1.0.**

Refer to the documentation included with your product to determine whether it contains these power supplies. First, shut down the product and disconnect all AC power cords. English 13 All troubleshooting and repair procedures are detailed to allow only subassembly or module level repair. Because of the complexity of the individual boards and subassemblies, do not attempt to make repairs at the component level or to make modifications to any printed wiring board. Improper repairs can create a safety hazard. For floorstanding products, install and extend bottom stabilizers before installing options and boards. Verify that the AC power supply branch circuit that provides power to the rack is not overloaded. Refer all servicing to qualified personnel. **WARNING** To reduce the risk of injury from electric shock hazards, do not open this enclosure. Refer all maintenance, upgrades, and servicing to qualified personnel. This symbol indicates the presence of electric shock hazards. The area contains no user or field serviceable parts. Do not open for any reason. **WARNING** To reduce risk of injury from electric shock hazards, do not open this enclosure. This symbol on an RJ45 receptacle indicates a Network Interface Connection. **WARNING** To reduce risk of electric shock, fire, or damage to the equipment, do not plug telephone or telecommunications connectors into this receptacle. This symbol indicates the presence of a hot surface or hot component. If this surface is contacted, the potential for injury exists. **WARNING** To reduce the risk of injury from a hot component, allow the surface to cool before touching. 12 English. These symbols on power supplies or systems indicate the equipment is supplied by multiple sources of power. **WARNING** To reduce the risk of injury from electric shock, remove all power cords to completely disconnect power from the system. This symbol indicates that the component exceeds the recommended weight for one

individual to handle safely. Weight in kg. <http://www.ilaszczuk.pl/quick cms/userfiles/04-ktm-450-exc-service-manual.xml>

Weight in lb. **WARNING** To reduce the risk of personal injury or damage to the equipment, observe local occupational health and safety requirements and guidelines for manual material handling. **General Precautions.** This page requires Javascript. space, and no RAID controller, this configuration is ill-suited for heavy networking applications.

Nevertheless, its rugged design and redundant power supplies do make it worth a look as a file server for small to midsize workgroups. However, the PIII500-based system's performance scores trailed those of the leaders by about 10 percent in the SQL and network tests and by nearly 40 percent in the file service test, placing the Gateway next to last in overall performance. To access the front of the internal drive cage, for example, you must take off the two side panels, remove two small screws, squeeze a number of plastic tabs, and then pop off the front panel. By loosening just five more screws, you can slide out the cage to install or remove 3.5-inch devices. A second drive cage accommodates two more 3.5-inch devices inside the unit, but you must take out the entire cage to reach its contents. As a result, swapping out the power supply means digging around inside the machine to unplug and reconnect every power plug on every device individually. Likewise, installing hot-swappable drives is easy. The RAID subsystem cage is accessible without any disassembly, and it has its own cooling fan. This proactive approach can save a frantic midnight call to tech support, but only if you are organized enough to keep track of all the separate sheets of paper. Its best use is as a general-purpose server for small to medium-size networking environments. In order to post comments, please make sure JavaScript and Cookies are enabled, and reload the page. Get maintenance and service guide. Turns out my "won't boot; blank screen" nx7000 just needed the VGA cable reseated. Having the manual made it that little bit easier. Magic! Strange that the vid card would stop the whole thing booting, but hey, now I've seen it with my own eyes! It works for a bit and then fails in a similar fashion or by showing video artefacts which then crashes the machine anyway. I can't work out exactly what's wrong because the slightest pressure or movement causes it to fail. It's a few years old now but hasn't been dropped off a cliff recently so what gives. VERY annoying, any other suggestions apart from a hammer or super glue!!p I have a zv6000 and the screen is almost black except for a slight image, I've attached an external monitor and the video works fine. So, I just received a replacement inverter. I'm ready to jump in but the HP manual doesn't show how to take apart the LCD only how to remove. Last year, I accidentally spilled water on it. It shut off by itself, but somebody turned it on immediately, it shut off by itself again. Then it won't boot. I took the laptop apart, blew dry all the parts, and put them back together. It boots, but only when the battery has power in it AND the AC adapter is NOT plugged in. Isn't that weird! I found the light on the AC adapter was off by itself, and then the battery was drained. That was why the laptop was off.

But I really had a very hard time turning it back on. Somehow the battery had a little power left, just enough to turn it back on, and within literally a second I plugged the AC power in and started charging the battery. But I am very annoyed by the fact that if the battery goes bad eventually, the laptop will be useless. What possibly went wrong. How can I fix it? It's hard to guess what is wrong without testing the laptop with a known good keyboard. Most likely it's just a bad keyboard, but it's

also possible that the keyboard controller on the motherboard is bad not very common. I would try replacing the keyboard, you have a good chance to fix the laptop. I took it to the shop, but since I'm overseas, they were very unexperienced, and weren't quite sure what to do, told me I'd have to buy an entire new laptop keyboard similar to it for 1000 sr, which is really really expensive and won't come for 2 weeks, I dunno what's the deal. It's still under warranty, but the warranty isn't honored in a different country, only the country you bought it in, unfortunately. With both the power cable plugged in and not plugged in, it doesn't boot. It has power as indicated by the power light, but that is all it does, power on. The hard drive does not power on, and the DVD ROM acts like its going to then stops, and repeats this over and over. It initially beeped twice when it was first powered on, but after removing and reseating the ram that stopped. As it sits right now there is nothing but one stick of ram in it, no HD, no DVD, the needed hardware to get it started. I'm stumped at this point. Also odd note, compaq says these are all intel, but this one has a Mobile Sempron Sticker on it. Any ideas Maybe one memory slot on the motherboard is defective. Also, find a test the laptop with a known good memory stick. While I need to read my USB Saver 512 Mbyte, I have to restart the Laptop every time. Would you please to help me to solve this problem.

Thanks a lot, Mehran Or is there any modification on the wiring needed I resoldered the connector, but now the machine won't boot. Thanks to learning a bit from your site, I tried to systematically find out what was wrong. At this point, the memory modules were the only other thing plugged in. Result Fan starts up for 5 seconds or so, and turns off. Screen dark. Result Same as 1. Then the drive stops also. Result Same as 1. Result Same as 1. I started trying the buttons for the status display on the front edge and found that with an audio CD in the optical drive, I could get the display to show that it was trying to play the CD. That is, for example, to display would show it going to the first track and would start timing, as if it was playing the track. The CD itself with spinning in the drive. I tried putting the speakers back, and the little board that has the external volume and audio on off buttons to see if I would hear music. There was no sound. I'm pretty aware of precautions necessary to avoid static damage, so I don't think it's likely that that is what occurred. I'm also confused by the symptoms with the CDs that I described, because I don't know the relationship between that kind of CD playing from the front panel, with the computer off and the rest of the computer. At this point, the memory modules were the only other thing plugged in. Screen dark. Check if the video cable is properly connected to the motherboard. If the video connector on the motherboard has pins inside, make sure there are no bent pins. Check if the memory module is seated properly, move it into another slot and test the laptop again. If for some reason you removed the CPU during disassembly, make sure it's seated properly and LOCKED inside the socket. I have tried everything i can think of an i am still unable to connect to the internet. Router works fine. just can't get on the net. Do you see any yellow exclamation mark in the wireless card entry. Try reinstalling the driver.

Try reseating the wireless card, just remove it from the socket and install back in place. Make sure the wireless connection is not disabled. I cannot give you 100% remedy for this problem, there could be many different hardware or software related issues. After I pushed on the power button, fans started spinning and were active for a few seconds, LED is on, but my laptop still blank not display any thing and not working, no beep sound. If you have two modules, try removing them one by one and test the laptop with each RAM stick separately. If you have only one module and reseating it doesn't help, try replacing it with a known good memory module. It could be just a bad RAM. After I pushed on the power button, fans started spinning and were active for a few seconds, LED is on, but my laptop still blank not display any thing and not working, no beep sound. If you reseated the memory module and it didn't help, try replacing it with a known good RAM. If you have two memory modules installed, remove them one by one and test the laptop with each module separately. It is possible that one of the modules is bad. Just in case try this. Unplug the power cord, remove the battery and wait for 23 minutes. Then plug the power cord and turn on the laptop. Sometimes it helps. It is necessary to open up the laptop and take a look at the motherboard. Do not use the

laptop until then, you can make it worse. Take your laptop to a professional repair shop for diagnostics. Try reseating the memory modules first and if it doesn't help, test the laptop with a working memory module. Also, remove the hard drive and try starting the laptop without it. Sometimes a faulty hard drive can halt the entire system. If you get video on the screen without the hard drive installed, but no video with the hard drive, most likely this is your problem. When I move my LCD back and forth, my screen goes blank although my computer is working. I have to restart to start it working again.

Recently I found out the the problem is the cable going from my LCD to the main board. How can i replace the cable I'm at a complete loss. The laptop "sees" your USB mouse, so most likely there is nothing wrong with USB ports. The laptop can play CDs and DVDs, so most likely there is nothing wrong with the optical drive or the motherboard controller. You can try this. 1. Using System Restore revert the operating system back to the time when it was working properly. If it doesn't help, go to the next step. 2. Backup all important personal files and reinstall the operating system from scratch. My screen would go out if the screen was moved but you could still see it a very little bit. Hope this helps. Does not turn on at all at present. Battery charging light does not come on. Tried with memory, without memory, different slots, different memory. Nothing happens! Its a new battery it did manage to charge it a bit once when it was turned on, and stayed on for a hour or so but also tried the original old battery. Its also a new psu, which is putting out 19v with the right amperage for that model. When it did power up, it worked fine until it turned off instantly after a random amount of time. Nothing happens when power button pressed. Tried leaving it unplugged, without battery for hours, no joy. Tried removing the bios battery, and leaving it unplugged for ages, before putting battery back. No joy. Any suggestions Remove the battery and start the laptop from the AC adapter. Does it work from the AC power Can some one please be good enough to advise me how I could find it for my laptop. Thanks I want to take apart the keyboard and check that specific key. After taking out and disconnecting the keyboard, the underside has a clear plastic cover which is bonded to the main board of the keyboard. The small screws which I suspect have to be removed to completely disassemble the keyboard are covered by this clear plastic shield.
